Introduction

Dear Parents and Carers

Students will soon be commencing the next phase of their learning as they move into the Year 9 – 10 program of study, known as our STEM Futures Program. This handbook is designed to support students and parents in selecting subjects for their program of study. I encourage you to review the contents of this handbook to learn about our STEM Futures Program and its importance in supporting students' transition from the IB Middle Years Programme to the IB Diploma Programme. The STEM Futures Program marks the start of students considering the subjects they are interested in studying in their IB Diploma, so important consideration is necessary.

To help families make subject selections, this booklet provides an overview of the curriculum as one of a number of strategies to ensure that students make informed choices that comply with the rules of the IB Middle Years and Diploma Programmes. While the Academy aims to offer all subjects listed in this booklet, it is important to note that this will be dependent on class numbers and the Academy's staffing capacity. Some subjects may not be able to be offered if minimum numbers are not met.

Students are required to complete their STEM Futures Program subject selection online. Details for completing the online subject selection will be provided by email, including dates for completion. The subjects available for selection are listed at the back of this booklet. The checklist on the subject selection page should be used as a guide to deciding on your subject selections.

Regards,

Tanya Haggarty

Associate Principal Academic

Queensland Academy for Science, Mathematics and Technology

Our Mission and Values

Our Vision

A world-class education that nurtures excellence and fosters global citizenship for an ever-changing world.

Our Focus

A STEM education enriched through a broad liberal arts curriculum.

Our Purpose

We will educate our young people to:

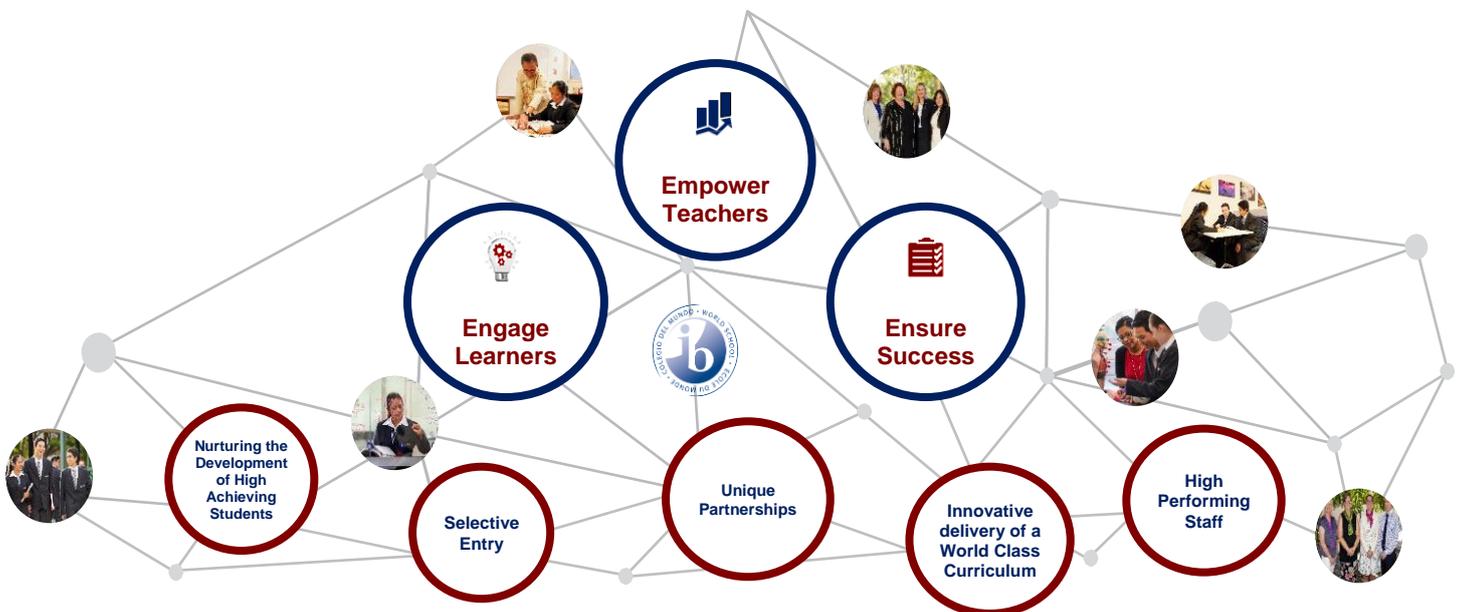

- be life-long, curious, agile and resilient learners
- think critically and use evidence-based decision making to imagine and realise change
- be effective collaborators and communicators in disciplinary and interdisciplinary contexts
- use technology strategically and ethically
- contribute to and impact on the world around them in ethical and sustainable ways
- interest in local and global cultural contexts with knowledge of and respect for diverse cultural perspectives.

Our Values

Inquirers	Open-minded
Knowledgeable	Caring
Thinkers	Risk-takers
Communicators	Balanced
Principled	Reflective

International Baccalaureate Mission Statement

The International Baccalaureate® aims to develop inquiring, knowledgeable and caring young people who help to create a better and more peaceful world through intercultural understanding and respect.

Overview of QASMT Curriculum Programs

The Year 7 – 12 curriculum framework at QASMT has been specifically developed to provide a STEM focussed curriculum, through the International Baccalaureate (IB) Middle Years Programme (MYP) and Diploma Programme (DP).

Year 7 – 8 Foundation Program

A rigorous and accelerated curriculum program developed through the IB Middle Years Programme, Year 3 standards, and mapped to the Australian Curriculum as relevant. The program is delivered through six full year courses and two semester courses across the eight MYP subject groups. Students choose their Language Acquisition and Arts courses.

Year 9 – 10 STEM Futures Program

A STEM focussed curriculum program, developed through a core curriculum of Language and Literature, Mathematics and Language Acquisition and a STEM Futures curriculum across Sciences, Individuals and Societies, Design, The Arts and Physical and Health Education. The Year 9 program is developed through the IB Middle Years Programme, Year 5 standards, and mapped to the Australian Curriculum as relevant. The program culminates in completion of a STEM Futures Project. The Year 10 program is a bespoke program developed to prepare students for the rigours of the IB Diploma Programme and mapped to the Australian Curriculum as relevant. The program is delivered through semester core subjects and STEM Futures electives. The program culminates in the final semester with a Diploma Preparation Program.

Year 11 – 12 Diploma Program

A rigorous, university preparation curriculum program, developed through the IB Diploma Programme. The programme is studied across six subject areas, either one subject in each subject group or two subjects in either Sciences or Individuals and Societies, instead of a subject in Arts. All students study three subjects at Standard Level, three subjects at Higher Level subjects and the inner core subjects, Theory of Knowledge, Extended Essay and CAS (Creativity, Activity and Service).

The IB Learner Profile

The aim of all IB programmes is develop international mindedness in students who, recognising their common humanity and shared guardianship of the planet help to create a better and more peaceful world. IB learners strive to be:

Inquirers	They nurture their curiosity, developing skills for inquiry and research. They know how to learn independently and with others. They learn with enthusiasm and sustain their love of learning throughout life.
Knowledgeable	They develop and use conceptual understanding, exploring knowledge across a range of disciplines. They engage with issues and ideas that have local and global significance.
Thinkers	They use critical and creative thinking skills to analyse and take responsible action on complex problems. They exercise initiative in making reasoned, ethical decisions.
Communicators	They express themselves confidently and creatively in more than one language and in many ways. They collaborate effectively, listening carefully to the perspectives of other individuals and groups.
Principled	They act with integrity and honesty, with a strong sense of fairness and justice, and with respect for the dignity and the rights of people everywhere. They take responsibility for their actions and their consequences.
Open-minded	They critically appreciate their own culture and personal histories, as well as the values and traditions of others. They seek and evaluate a range of points of view, and they are willing to grow from the experience.
Caring	They show empathy, compassion and respect. They have a commitment to service, and they act to make a positive difference in the lives of others and in the world around us.
Risk-takers	Or Courageous. They approach uncertainty with forethought and determination; they work independently and cooperatively to explore new ideas and innovative strategies. They are resourceful and resilient in the face of challenges and change.
Balanced	They understand the importance of balancing different aspects of their lives— intellectual, physical, and emotional—to achieve well-being for themselves and others. They recognize their interdependence with other people and with the world in which they live.
Reflective	They thoughtfully consider the world and their own ideas and experience. They work to understand their strengths and weaknesses in order to support their learning and professional development.

Academic Integrity

QASMT recognises that academic integrity is embodied within the IB Mission Statement, values and IB Learner Profile. QASMT has developed an Academic Integrity Policy which is enacted throughout the Academy. A clear, positive approach to academic honesty as good practice is imperative to ensure that:

- teacher and student integrity is promoted through sound teaching and learning practice
- student research is properly conducted
- assessment is authentic
- intellectual property and copyright regulations of Australia are upheld. This policy is consistent with the International Baccalaureate's philosophy and expectations and is designed to support the Middle Years Programme's Standards and Practices.

The aim of this academic integrity policy is to:

- promote the principles and practices of academic integrity to ensure that students and teachers are fully aware
- ensure that students do not have unfair advantage over other students through academically dishonest practices such as collusion, duplication, plagiarism or assessment misconduct
- ensure that the principles and practices of academic honesty are explicitly taught
- detail the opportunities which students receive to learn about and practise academic honesty
- define the specific skills and knowledge students need, to practise academic honesty
- outline the procedures to be taken when malpractice or infringement may have occurred
- to provide a coherent approach across all year levels.

What is ‘STEM Futures’?

The notion of ‘STEM Futures’ was inspired to achieve a culmination of our vision and focus, a world-class STEM education that nurtures excellence and fosters global citizenship for an ever-changing world. Describing a STEM education is sufficiently broad to allow for development of our own definition and by encompassing a ‘futures’ notion we can aim towards a program to meet the following:

A STEM education is an approach to learning where rigorous academic concepts are coupled with real-world lessons as students apply science, technology, engineering, or mathematics in contexts that make connections between school, community, work, and the global enterprise, enabling the development of STEM literacy and with it the ability to compete in the new economy (adapted from Tsupros, 2009).

The vision of our STEM Futures Program is to deliver a future-focussed STEM curriculum that engages passionate, innovative learners capable of creating positive and sustainable change in the world. To achieve this vision, we have developed a curriculum through the IB MYP aligned to the IB DP.

The curriculum is comprised of STEM Futures Electives, written in collaboration with university/industry links to provide a challenging and engaging curriculum designed to enhance students’ knowledge, understanding and skills in STEM and global citizenship. Our collaborators so far include, The University of Queensland, Queensland University of Technology, Moreton Bay Environmental Education Centre, Queensland Virtual STEM Academy and SPARQ-ed; we are continuing to expand our collaborations as we develop this new and exciting curriculum.

Course structure of the STEM Futures Program

Our STEM Futures Program in Year 9 and 10 has been designed to provide a ‘bridge’ for our students in moving from the IB MYP to the IB DP. The alignment of these programs can be seen in the Year 7 – 12 Subject Overview table below. Details of each STEM Futures Elective and alignment of the electives to DP subjects can be seen in the next section and are a very important part of the subject selection process.

Year 7 – 12 Subject Overview

This table represents our full proposed Year 7 – 12 subject overview, please note all subject offerings and timings are dependent on resourcing and are only finalised after subject selection each year.

IB Subject Group	Year 7 & 8		Year 9		Year 10 Semester 1		Year 10 Semester 2		Year 11 & 12		
	Subject Name	Mins/week	Subject Name	Mins/week	Subject Name	Mins/week	Subject Name	Mins/week	Subject Name	Mins/week

Year 9 STEM Futures Electives

The following table lists the electives on offer in Year 9. Students choose six (6) STEM Futures Electives from the lists below. At least one elective must be chosen from each category. Students must choose a Category A, B and C elective, the remaining three electives can be chosen across any category.

Elective Group	Elective Name	IB Diploma Programme Subjects												
		Business Management	Economics	Psychology	History	Digital Society	Environmental Systems & Societies	Biology	Chemistry	Physics	Computer Science	Sport, Exercise & Health Science	Visual Art	Music
Category A	Fuelling the Planet							X	X					
	Biochemical Solutions							X	X					
	World of Reactions								X					
	Medical Physics									X				
	Sustainable Futures						X	X						
Category B	World in Your Pocket	X	X											
	Forensic Psychology			X				X						
	Cultural Revolution		X		X									
	Future Global Cooperation	X	X		X									
Category C	Healthy Future							X				X		
	Disrupting the Market	X				X								
	Biomedical Engineering					X				X				
	Future of Automation					X					X			
	Artists as Change Makers												X	
	Soundtrack													X
IB DP Group Number		3	3	3	3	3	3/4	4	4	4	4	4	6	6

How do students choose their Year 9 electives?

The STEM Futures Electives are designed to allow students to start to specialise in their subject selection and focus on their curriculum areas of interest. To choose their electives for Year 9, students and families should follow these steps.

1. Consider the subjects the student is interested in studying in the IB Diploma Programme. A guide to IB DP subjects is available in this handbook on pages 27 to 32. Please read this section carefully and make a list of the subjects the student is most interested in studying in the IB DP. Note the IB DP subject group of the subjects in the list and ensure the student has chosen at least one subject from each group or two subjects from Group 3 or Group 4 instead of a Group 6 subject. It doesn't matter if you have more than six subjects you are interested in at this stage. You might want to consider pre-requisites for university courses, this is a handy link to information on The University of Queensland website <https://future-students.uq.edu.au/study>. Another handy link to considering future course interests is available from Queensland University of Technology at <https://match-my-skills.qut.edu.au/>.

2. Read the Overview of Year 9 STEM Futures Electives section in this handbook. Make a list of the STEM Futures Electives you are interested in studying; you will need at least six subjects in your list and remember that at least one subject has to come from each category (A, B and C).
3. Use the STEM Futures Electives table on page 10 to find the alignment to the IB DP subjects. Note which STEM Futures Electives align with the IB DP subjects you are interested in.
4. If you still have more than six electives on your list, think about removing any that double up with the IB DP subjects you are interested in. You need to ensure your final list of six, has alignment with each IB DP subject you are interested in.

Year 10 STEM Futures Electives

The following table lists the electives on offer in Year 10. Students choose three (3) STEM Futures Electives from the lists below. At least one subject must be from IB Diploma Programme Group 3 (Category A) and one from Group 4 (Category B), the remaining elective can be chosen from Group 3, 4 or 6 across all categories.

Elective Group	Elective Name	Business Management	Economics	Psychology	History	Digital Society	Environmental Systems & Societies	Biology	Chemistry	Physics	Computer Science	Sport, Exercise & Health Science	Visual Art	Music
Category A – Individuals & Societies	Show Me the Money	x												
	Tragedy of the Commons		x											
	Inside Your Head			x										
	Global War and Peace				x									
	Living in a Digital Society					x								
A&B	Blue Planet					x								
Category B – Sciences	Medical Biotechnology							x						
	Future Materials								x					
	Journey to Earth X									x				
	Computational Thinking										x			
	Peak Performance											x		
	Unpacking the World Around Us											x		
	Intrepid												x	
	IB Diploma Programme Group Number	3	3	3	3	3	3/4	4	4	4	4	4	6	6

How do students choose their Year 10 electives?

The STEM Futures Electives are designed to allow students to specialise in their subject selection and focus on their curriculum areas of interest and to prepare for the IB Diploma Programme. To choose their electives for Year 10, students and families should follow these steps.

1. Decide on the subjects the student is interested in studying in the IB Diploma Programme. A guide to IB DP subjects is available in the handbook. Choose one subject from each of Group 3 and Group 4 and choose a third subject from either Group 3, 4 or 6.
2. Use the STEM Futures Electives table on page 11 to find the alignment to the IB DP subjects. Note which STEM Futures Electives align with the IB DP subjects you are interested in.
3. Read the Overview of Year 10 STEM Futures Electives in this handbook. Make a list of the STEM Futures Electives you are interested in studying.
4. If you still have more than three electives on your list, you will need to make a decision about which three IB DP subjects you are going to study so that you can choose the STEM Futures Electives which align with your IB DP subject choice.

Year 9 STEM Futures Electives Overviews

Fuelling the Planet

Curriculum Focus

Global energy use is increasing and fossil fuels continue to provide the vast majority of energy consumed worldwide. We use energy every day, to fuel our transport needs, generate electricity, power electronic devices, heat and cool our homes and provide light. Modern combustion fuels rely on transforming the energy stored in chemical bonds into useful forms of energy. However, harnessing the energy from non-renewable fossil fuels can also release undesirable products such as carbon dioxide, contributing to global climate change.

This elective explores the potential and pitfalls of alternatives to combustion fuels that align with our values of sustainability while also satisfying our future energy needs. Alternative fuels from renewable sources, including biofuels, nuclear power, hydrogen fuel cells and harnessing the energy from the sun, and wind sources may provide for cleaner, more sustainable energy than combustion of fossil fuels. Additionally, emerging research in new technologies for energy storage such as high-capacity long life batteries have the potential to revolutionise portable electronics, transportation and electricity generation.

Learning Outcomes

By the completion of this elective, students will:

- understand how energy is transferred in chemical reactions
- develop knowledge and understanding of electricity generation from a range of sources
- investigate renewable resources and alternative fuel sources
- design, analyse and evaluate experimental methods and data
- explore solutions to our future energy needs.

Biochemical Solutions

Curriculum Focus

Biochemical solutions combine the principles of biology and chemistry to develop products from raw materials and develop the processes for achieving this. Biochemical engineers develop new ways to use cells, enzymes and other biochemical agents to find solutions to global challenges and develop sustainable technologies. This elective will introduce students to some of the applications of biochemistry to solve current issues, such as producing new, cleaner fuels from natural resources, developing and implementing processes to produce food and drinks and improved approaches to reducing and dealing with environmental pollution.

Students will journey into the cell and its machinery to support life processes. They will explore the chemical changes in living things and applications that harness the power of these changes to create new products and processes. This elective will also explore the social, economic and environmental impact of science and technology, such as oil-eating bacteria that can help clean up pollution and spills, the use of microalgae in treating wastewater and microbial fuel cells to producing biodegradable materials to sustain the future of our planet.

Learning Outcomes

By the completion of this elective, students will:

- apply knowledge of cell biology and biochemistry in a range of applications
- understand the factors that affect rates of reactions and the action of biological catalysts
- explore biochemical solutions to sustainability
- design, analyse and evaluate experimental methods and data
- predict how future applications of science and technology may affect people's lives.

World of Reactions

Curriculum Focus

Chemical reactions happen everywhere, every day, inside us and all around us, constantly occurring within plants and animals, the air in our atmosphere, the lakes and oceans that we swim in, and the soil where we grow our food. There is a staggering array of chemical reactions and understanding them is essential to understanding life and the world around us. We use chemical reactions to make useful products that make our lives easier. However, sometimes these products, such as plastics and the chemicals in our electronics and electrical equipment, can also have harmful effects on our environment. By understanding how chemical reactions work, scientists are able to predict the outcome of reactions, identify the products formed, make chemical processes more efficient and conserves the environment.

In this elective, students will extend their understanding of atoms and atomic structure and its relationship to chemical processes. A wide range of chemical reactions will be studied and students will learn to represent these using chemical symbols, formulae and equations. Students will examine the nature and reactions of acids and of metals, and investigate their use and impact in various applications such as ocean acidification, green chemistry, electronics and electrical equipment. Students will apply their understanding of chemical reactions to evaluate how the application of chemistry in contemporary issues affects people's lives.

Learning Outcomes

By the completion of this elective, students will:

- investigate the physical and chemical properties of elements and compounds
- perform experiments involving various types of chemical reactions
- represent chemical reactions using balanced formulae and equations
- collect, analyse and evaluate data involving chemical reactions
- conduct a scientific inquiry concerning an application of the chemical reactions studied
- solve problems using mathematical methods.

Medical Physics

Curriculum Focus

Medical physics is the application of physics to healthcare and the use of physics for patient imaging, diagnosis and treatment of disease. The field of medical physics has played a key role in the evolution of modern medicine ever since the discovery of X-rays by Roentgen in 1895 and Becquerel's 1898 discovery of radioactivity. Diagnosis involves the use of medical imaging techniques including x-ray imaging, and ultrasound. Treatments such as radiation and nuclear therapy can involve the use of x-rays, electrons and other radioactive particles for treating diseases such as cancer.

The elective brings Physics principles to life through their relevance and practical application to modern medical diagnosis and treatment. It will provide students with an introduction to the properties of electromagnetic radiation, sound and radioactive decay. The unit also explores organs and systems and how their physical properties facilitate medical imaging and treatment. The elective will include the study of waves including optics and its applications. Students will also learn about the science behind some of the instrumentation of modern medical technologies that include radiation therapy, ultrasound and x-rays.

Learning Outcomes

By the completion of this elective, students will:

- develop knowledge and understanding of waves, the wave equation and the electromagnetic spectrum
- explore applications of radioactive particles and the use of isotopes in nuclear medicine
- investigate medical procedures such as laser eye surgery and medical imaging techniques such as ultrasound, x-ray and CT
- solve problems using mathematical methods
- conduct scientific inquiry and evaluate experimental methods and data.

Sustainable Futures

Curriculum Focus

Sustainability addresses the ongoing capacity of Earth to maintain all life. This elective develops the knowledge, skills, values and world views necessary for students to act in ways that contribute to a sustainable future, and focuses on human challenges to protecting environments and creating a more ecologically and socially just world

through informed action. This elective aims to build knowledge and understanding of how actions to improve sustainability are individual and collective endeavours shared across local and global communities.

By 2050, the population of the world is estimated to reach 9.8 billion. One of the key challenges for a sustainable future is the need to develop cities to support this population growth. Cities of the future need to address this challenge through principles of sustainable design that focus on ecology, water usage, energy consumption, waste management, food production, culture and recreation, health and wellbeing, travel and mobility, business and suburban infrastructure, and education. Students will use their critical thinking skills and innovative ideas to find potential solutions for this current and emerging problem. **Learning Outcomes**

Learning Outcomes

By the completion of this elective, students will:

- understand the flow of matter and energy through ecosystems
- explore biomes in different regions of the world
- develop skills in field techniques
- apply critical thinking skills to address future challenges
- research and develop design solutions for cities of the future

World in Your Pocket

Curriculum Focus

Globalisation, when viewed through the lens of business and economics, explores the increase in international trade, investment, competition, and growth; it becomes a driving force behind the free movement of people, goods, capital and enterprise. All businesses must 'think locally and act globally'.

The World in Your Pocket elective takes students on a journey through global trade networks and marketing strategies. Students explore the process a product goes through from production to purchase. A mix of assessment methods allow inquiry into economic systems, industrial sectors, marketing strategies, entrepreneurship and emerging competitors. Students investigate and analyse economic trends to make informed business decisions and predictions.

Learning Outcomes

By the completion of this elective, students will:

- understand Australia's position within an interdependent global economy
- examine major global trade relationships and benefits
- assess the impact of current global events on the Australian economy
- explore the marketing mix
- investigate national and international competition

Forensic Psychology

Curriculum Focus

Forensic psychology combines the study of psychology and the legal system and focuses on the application of psychological theory and practice to the criminal, court and corrections systems. Using a case study approach, students will examine a range of forensic evidence that may be used to build a criminal profile. Students will also explore various biological and psychological explanations for criminal behaviour.

This elective will provide a foundational understanding of neurobiology and neurophysiology to understand the biological basis of behaviour and learning, including the anatomy of the brain and biochemical imbalances. This elective will also provide an understanding of behavioural and cognitive explanations of criminal behaviour. The intersection of biology, psychology and the law will include related topics such as crime scene analysis, jury behaviour, eyewitness and expert testimony and the key principles of the justice system. Examination of the different types of sentencing, and relevant research will provide students with an understanding of the legal system and how to make a case.

Learning Outcomes

By the completion of this elective, students will:

- develop knowledge and understanding of the nervous system, brain anatomy, learning and cognitions
- understand the key principles of Australia's system of justice and the role of Australia's court system
- investigate biological, cognitive and social explanations of crime
- consider how a range of evidence is used to make a case and reach a verdict
- develop skills of inquiry, investigation and critical thinking.

Cultural Revolution

Curriculum Focus

The study of History is not merely the study of the past; it is an organic discipline, continually being reviewed in light of changing perspectives, the discovery of new evidence and revision from new schools of thought. It is the interpretation of the past in the present. In the years following the Second World War, significant social change occurred largely driven by the cultural revolution of the 1960s. Social history emerged in this period as a new field of historical study, focusing not on the history of great men and great ideas but on the experiences and achievements of ordinary people. The practices, beliefs, and objects from the period document the story of a world in transition. New technologies made the world a smaller place where ideas and cultural experiences could be shared at unprecedented levels.

The Cultural Revolution elective will explore the rapid cultural change experienced in Australia in the post-war period as it transitioned from a young nation to a multiculturally progressive society. In the 60 years following the Second World War, the ideas and sounds of global movements reached the people of Australia and triggered a rise in social movements which are documented in the sounds of the music industry, the stories told in film and television and the pursuit of sporting greatness. Television and rock'n'roll music arrived in 1956 and had a significant influence on all groups in Australian society giving rise to the 'juvenile delinquent', or teenager. As these delinquent's grew up, they would champion significant social change including the push for civil rights for Indigenous Australians and a the withdrawal of Australian troops from the Vietnam War. The Cultural Revolution elective will consider the achievements of Australia's first 'teenagers' and the lasting impacts of their pioneering efforts.

Learning Outcomes

By the completion of this elective, students will:

- understand how the end of the second world war marks a significant turning point for Australian society
- examine significant post-WW2 movements including; conservatism, rebellion, political and social movements and national identity
- analyse source material for a decline of British influence and the development of closer political and social connections with the USA and Asia
- assess the role of new technologies in the development and exportation of Australian media
- explore the role of regional and global events on the development of Australian national identity.

Future Global Cooperation

Curriculum Focus

For a young nation, Australia ranks as one of the best places to live in the world by international comparisons of wealth, education, health and quality of life. Heavily influenced by mass immigration following the Second World War, Australia emerged from the period as one of the world's most multicultural countries. Foreign policy has also undergone significant change in the post war period. No longer looking solely to Europe or the United States of America, Australia has developed strong political and economic ties in the Asia-Pacific region.

The Future Global Cooperation elective will examine the key principles of the Australian political system, which enable stability and foster national prosperity. Students will develop a deep understanding of how the Australian government operates, how the citizens' choices are informed by the media and the structures in place to protect diversity and multiculturalism. Comparisons will be drawn with contrasting government types throughout the Asia-Pacific region. With a well-grounded understanding of the roles and responsibilities of the Australian government on a national scale, the elective will then turn its focus to how Australia participates on a global scale, helping to maintain peace and security for all through its work with the United Nations.

Learning Outcomes

By the completion of this elective, students will:

- compare different types of government
- understand the structure of Australia's political system
- examine the role of political parties in Australia
- unpack the international roles and responsibilities of the Australian government
- explore Australia's contributions to foreign aid, peacekeeping and participation in international organisations.

Healthy Future

Curriculum Focus

The world now has more young people than ever before – of the over 7 billion people worldwide, approximately 26% are under the age of 15. In this elective, students will explore the current and future health issues facing adolescents, both locally and globally. Students will identify challenges to adolescent health such as regular physical activity, balanced use of technology, balanced nutrition, a healthy state of mind and community connection.

An appreciation of how the human body works is essential in understanding the basis of health and prevention strategies. Students will learn how human cells, tissues and organ systems function together to carry out the activities needed to maintain internal balance for a healthy life. The impacts of regular physical activity, the use of technology and unbalanced nutrition on the physiological systems responsible for the maintenance of health in humans will be explored. Students will also examine the external influences that could impact on their ability to make good decisions and plan a creative health promotion that addresses a contemporary or future health concern.

Learning Outcomes

By the completion of this elective, students will:

- investigate the physiological basis of various health issues on the human body
- explore the impact of contemporary issues on adolescent health
- generate questions that can be investigated using scientific inquiry including observation, data recording, data analysis and critical thinking
- implement and refine leadership and collaboration skills
- apply and evaluate practical physical, tactical and strategic skills in a range of exercise and physical activity settings.

Disrupting the Market

Curriculum Focus

In 2015, the Australian Prime Minister, the Hon Malcolm Turnbull MP, stated that ‘the Australia of the future has to be a nation that is agile, that is innovative, that is creative.’ It is predicted that the youth of Australia will average 17 changes in employers across five different careers in their lifetime. The stability of industry is shifting and for the next generation of Australian leaders, this will have significant impact on their lives. Leaders of tomorrow need to be more than activists for change, they must be disruptors. Disruptors are generally entrepreneurs, outsiders, and idealists rather than industry insiders or market specialists. Disruptors are often linked to the fast-moving technology industry but can be found in almost any area of business. They need to be opportunity-aware, take risks and utilise a range of behaviours, such as initiative and innovation that create value and contribute to their success. To be successful in emerging careers, individuals will not only need skills in scientific fields but also as entrepreneurs.

The Disrupting the Market elective will see students develop an entrepreneurial toolbox of skills positioning them as future leaders, disrupting existing markets and enacting change for the future. Utilising the design cycle, students will apply a range of Economics and Business knowledge and skills including the Ansoff matrix, break even and triple bottom line to develop a solution to an identified problem, developing their critical thinking and problem-solving skills. The unit provides students with opportunities to work collaboratively with their peers to utilise laser cutter technologies.

Learning Outcomes

By the completion of this elective, students will:

- understand the qualities and skills of successful entrepreneurs
- explore the roles and responsibilities of individuals in the workplace
- apply the design cycle to the creation of a product/service
- develop a range of feasible design solutions to a defined problem
- collect data to evaluate the success of a solution.

Biomedical Engineering

Curriculum Focus

Biomedical engineering is a rapidly growing transdisciplinary field that bridges that gap between technology, medicine and biology. With the rapid development in technologies, 3D modelling holds the promise of changing

the healthcare industry for the better. Our biomedical engineers need to be accomplished researchers, designers, collaborators and excellent communicators. They also need a strong understanding of the scientific principles of their field.

The Biomedical Engineering elective will offer an authentic learning experience where students are able to explore the link between engineering and the human body. Using 3D modelling techniques students will develop and test models that will deepen their understanding of a range of biomedical solutions. Students will learn how to effectively communicate their findings, which is a key skill for scientists and designers.

Learning Outcomes

By the completion of this elective, students will:

- develop an understanding of the engineering design process
- apply scientific principles to the design process
- explore a range of properties of materials
- use 3D printers to test their model
- develop, modify and communicate ideas.

Future of Automation

Curriculum Focus

Significant advances in technology over the last two decades, are providing now more than ever, increasing opportunities for the world population to spend time focusing on matters of global significance and less on repetitive, mundane tasks. One way in which computer scientists, mathematicians and engineers are investigating how technology can help to support this change, is in the research area of automation, where systems are designed to be less human dependent and more self-reliant. This elective introduces students to a real-world problem situated at the intersection of these cutting-edge STEM fields. Through the knowledge and skills students will learn in this elective, students will reflect on what the automation means for current and future generations, with particular focus on the development of technological and/or engineering solutions which will be required for successful automation.

Future of Automation asks students to investigate a variety of automated systems and discuss a range of technologies currently in use or being researched within this area. Students will use the Arduino microcontroller, various sensors and actuators in a hands-on, problem-based learning environment to investigate automated systems on a smaller scale and to understand some of the questions and challenges that researchers are facing in the field. The elective will culminate in students designing, creating and presenting a prototype (made using an Arduino microcontroller) for an automated system which will solve a real-life situation they have chosen to investigate.

Learning Outcomes

By the completion of this elective, students will:

- develop an understanding of the role of automation now and in the future
- investigate the implementation of automated systems for the advancement of society
- synthesise multiple complex ideas to analyse, present and evaluate a solution
- explore the development of an automated product through the design cycle
- practice autonomy and confidence in applying and describing problem solving.

Artists as Change Makers

Curriculum Focus

Art and artists play an important role in effecting change and challenging audience perspectives by exposing the realities of modern life. It takes courage to see and do things differently. Change makers are inquisitive, open-minded, and resourceful. Contemporary artists around the world use creative and critical thinking, not only as part of the creative economy, but more importantly, to enhance the well-being of others and inspire a more just and beautiful world. Artists address concerns through emotional responses to their orientation in place and time, and draw inspiration from research in science, social history and community practices.

Students will experiment and gain knowledge and skills in traditional and digital art forms. This unit will engage young people in developing work using art to build deeper ties between artist and audience. Reflecting on their artistic intention and the impact of their work on an audience, students become more aware of the role that art plays in their lives and in the world.

Learning Outcomes

By the completion of this elective, students will:

- understand how and why artists use creative and critical thinking approaches
- experiment with and manipulate art media, techniques, styles and processes to realise ideas
- identify and explain how artists communicate and audiences interpret artworks through explorations of different viewpoints
- evaluate art practices from selected artists to inform their own artistic development
- produce a series of artworks that are conceptually linked and present their series to an audience.

Soundtrack

Curriculum Focus

Music is often a soundtrack to our lives as it is used to accompany personal milestones and celebrations, in times of happiness and sorrow, and also as we work, exercise or relax. Music is uplifting as it unites us within our personal social group, our community and across borders. As we collect a personal playlist of our own through a lifetime, certain songs or pieces take us back to a certain time in our life with others encouraging us to look to the future. Music allows us to express and maintain our identities so as performers, composers and participants in music, narratives are shared using common and original motifs and themes. Often the music score for a film or game is considered as a 'character' with some composers even being made into action figures alongside the action hero merchandise. Combining the power of music with the realism of film and video games offers added dimensions and possibilities to maintain identity and build relationships.

Soundtrack offers students a unique industry related experience digging deep into writing for and performing music from film and video games. The creative process offers a balance of technology and traditional music making in real life scenarios by experimenting with aspects such as genre, pace, texture, modulation, and rhythm - all choices students can make individually whilst meeting an overarching design brief. Students develop their knowledge of how ideas and intentions are communicated in and through Music. As students' progress through studying Music, they learn to value and appreciate the power of music to transform the heart, soul, mind and spirit of the individual.

Learning Outcomes

By the completion of this elective, students will:

- develop their own original, creative voices as multimedia composers and performers by exploring music for film and video games
- demonstrate a deeper working knowledge and understanding of the powerful role music plays in sustaining characters, plot, action, mood and sense of place
- analyse and explore different genres drawn from a range of cultures and regions furthering an aesthetic appreciation and enjoyment of music
- build on and refine their knowledge, understanding and skills through music practices focusing on rhythm, pitch, dynamics and expression, form and structure, timbre and texture
- embrace new technologies whilst maintaining traditional approaches to music making.

Year 10 STEM Futures Electives Overview

Show Me the Money

Curriculum Focus

An understanding of business is proven to better position graduates in the changing workforce. Successful business ventures require the individual to have not only the scientific and technical knowhow but also business prowess to sell it. Marketing plays a pivotal role in business strategy. The process of identifying, anticipating and satisfying ever changing consumer needs and wants is critical to the success of a business or brand. Companies like Apple, Virgin, Tesla Motors and Coca Cola rely heavily on marketing programs to ensure they stay in front of competitors and in the minds of customers. A successful marketing strategy will go a long way to ensuring a company is profitable.

Show Me the Money will explore the growth of small business in Australia and the reasons why businesses both succeed and fail. Students will learn how society influences business and the marketing techniques used. Applying the consumer decision theory, students will uncover the principles of consumer behaviour and marketing that influences purchase decisions. A number of consumer theories will be unpacked and assessed

for their connection to viable business ventures. Students will also consider the importance of effective decision making around pricing and production levels within a business, to determine when a business becomes profitable, the importance of cash flow in the success of business and how to make investment decisions.

Learning Outcomes

By the completion of this elective, students will:

- carry out effective primary market research
- identify how to effectively target and promote brands and products to customers
- recognise societal trends and how businesses can adapt to change
- identify and use the marketing mix.
- understand the role of financial decision making within a business.

Collaboration

- UQ Ventures
- Faculty of Business, Economics and Law; UQ Business School

Tragedy of the Commons

Curriculum Focus

Common access resources are natural resources including forests, fisheries, oil and gas fields, national parks, grazing lands and irrigation systems. They are characterised by the lack of property rights, difficulty with excluding people from using them and rivalry in consumption. Governments are called upon to play a significant role in managing resources on local, state and national levels, as well as cooperating with other nations, to address issues arising from the overuse of these resources. However, when resources are shared across jurisdictions this becomes problematic. The Tragedy of the Commons elective will explore the issue of common access resource in the pursuit of local and global sustainability.

Sustainability has increasingly become a key focus for governments, organisations and communities worldwide. Approaches to achieving sustainable practices can differ greatly as the concept of sustainability has a variety of interpretations dictated by the disciplines approach. Common to all approaches is responsible resource management which presents a problem when it comes to common access resources.

Learning Outcomes

By the completion of this elective, students will:

- examine issues of sustainability with an economic lens
- complete case studies into the management of common access resources
- explore issues of insufficient property rights
- draw connections between economic performance and living standards
- investigate sustainability and intergenerational equity.

Collaboration

- UQ Faculty of Business, Economics and Law; School of Economics

Inside Your Head

Curriculum Focus

The study of psychology is fundamentally about unlocking the secrets of what is Inside your Head and how this can help inform the understanding of our and others behaviour. During this psychology course you will take a journey that starts with the formative years exploring how humans and animals attach to caregivers and how these attachments can be interrupted affecting attachments to peers and partners later in life. The course also investigates how humans develop language ability and explore how some animals can learn language too, an ability often thought to be inherently human. We delve into major theories of learning and apply these to real world scenarios such as phobias, addictions, criminal behaviour and aggression. We identify key personality traits that drive our behaviours and affect our ability to manage stressful life events such as, moving to a new school, prepping for exam blocks and completing the IB. Furthermore, do the specific personality traits and lack of empathy found in psychopaths, sociopaths and narcissists make them immune to the same life stresses? Finally, we explore the history of intelligence testing and identify how the field continues to evolve and some of the controversies surrounding IQ testing. Throughout the course key psychological theories, studies and examples are used to support our learning. Importantly, the overarching key psychological debates of nature

versus nurture, free will versus determinism and reductionism versus holism underscore our understanding of the complexities of psychology in the real world.

Learning Outcomes

By the completion of this elective, students will:

- understand how stress is experienced biologically
- consider a range of research studies of intelligence and the ways it is measured
- explore the behaviourist approach and how it explains learning
- apply knowledge of learning theories to real life scenarios
- understand the influence of early attachment on later relationships
- apply and evaluate findings of research to explain behaviour
- describe a range of personality types and their major characteristics.

Collaboration

- UQ Faculty of Health and Behavioural Sciences; School of Psychology

Global War and Peace

Curriculum Focus

The First World War took close to 40 million military and civilian casualties. Glorified at the time as the 'war to end all wars', it marked a shift in global cooperation with the idealistic goal, for history to never repeat. The years that followed were riddled with destabilising events, the Great Depression, rise of radical political ideologies and the systematic extermination of racial groups in the Holocaust saw a return to global warfare just twenty years later. The Second World War reached a scale unimaginable by nations still trying to heal. Not fought in the far away trenches of Europe, the Second World War was closer to home than previously imaginable for many Australians.

The twentieth century became a critical period in Australia's social, cultural, economic and political development. Understanding the transformation of the modern world during a period of political turmoil, global conflict and international cooperation provides the context required to understand how Australia developed, establishing its place in the Asia-Pacific region and as a global peacekeeper. Global War and Peace will explore the long and short-term causes of the Second World War, the experiences of the individuals fighting in the European and Pacific theatres and those on the Australian home front. An understanding of the changing nature of global conflict in an interconnected nuclear age will be established through an exploration of Australia's foreign policy and involvement in global conflicts from Victory in the Pacific Day to the present.

Completion of the Global War and Peace STEM Futures elective will provide students with an understanding of key historical themes across the 20th century. The Semester 2 DPP for History will build upon this by looking closely at the rise of global superpowers against these periods of war and peace. The focus in DPP will shift from the Australian experience to the rise of the United States of America as the leader of the free world.

Learning Outcomes

By the completion of this elective, students will:

- investigate the changing nature of global conflict in the twentieth century.
- investigate the causes and effects of conflict on local, national and global scales.
- examine the significance of key events and experiences across the twentieth century on Australia, including the Second World War and the Vietnam War.
- assess the significance of World War II to Australia's international relations.

Collaboration

- UQ Faculty of Humanities and Social Sciences; School of Historical and Philosophical Inquiry

Living in a Digital Society

Curriculum Focus

We are (in) a digital society. Digital systems are changing our world and transforming how we think, communicate, collaborate and create. Nearly all organisations rely on computer systems to function in today's society: transportation systems, hospitals, banks, eCommerce and the entertainment industry. Living in a Digital Society invites students to explore two key popular concepts that are at the forefront of global innovation: big data and cyber security.

In our first unit, Being a Data Scientist, students will inquire into how past events, patterns or trends might help us to forecast future developments. Student will explore the concept of big data and how it is used in our everyday lives such as personalized recommendations in online stores and streaming services and weather predictions through visualizations. In our second unit, student will explore questions such as: What happens when IT systems come under attack. What is cyber-crime? Who is involved and what are the consequences? What is the profile of a computer hacker? Using real world examples, such as the Lazarus Group and the Bangladesh Bank Heist, we will explore how and why computer systems may be compromised and the impact of cyber-attacks.

Living in a Digital Society develops future-proof critical thinking skills by preparing students to “think like a practitioner” in the social sciences and humanities. This elective facilitates the transfer of learning to new situations and is excellent preparation for the Extended Essay and Theory of Knowledge components of the Diploma Programme. Through a structured inquiry framework, students will explore primary and secondary sources, both academic and contemporary, develop research method techniques (qualitative, quantitative or mixed), reflect and share their learning. As part of the collaboration, students may visit the UQ Cyber Security and computing facilities and attend specialised lectures and tutorials, both f2f and online, led by UQ academics.

Learning Outcomes

By the completion of this elective, students will:

- develop an understanding of how big data is used in our everyday lives
- develop a broad understanding of cyber security and motivations behind cyber crime
- explore diverse sources relevant to digital society
- develop transferrable academic research techniques
- investigate impacts and implications of digital systems for people and communities
- share discoveries about digital society with others.

Collaboration

- UQ Faculty of Engineering, Architecture and Information Technology; School of Information Technology and Electrical Engineering
- UQ Cyber

Blue Planet

Curriculum Focus

One of the United Nations sustainable development goals is to conserve and sustainably use the world’s oceans, seas and marine resources. The ocean drives global systems that make the Earth habitable for humankind. Our rainwater, drinking water, weather, climate, coastlines, much of our food, and even the oxygen in the air we breathe, are all ultimately provided and regulated by the sea. Careful management of this essential global resource is a key feature of a sustainable future. However, at the current time, there is a continuous deterioration of coastal waters due to increased urbanisation, leading to further issues of pollution and increased use of marine resources.

Australia has a large coastline with diverse and unique ecosystems. This includes the Great Barrier Reef Marine park, and 66 Ramsar wetlands (Wetlands of International Importance under the Ramsar Convention on Wetlands). Australia continues to be a popular International tourist destination and is set to play host to the 2032 Olympic games. Proposals for coastal development must therefore be evaluated in order to assess the environmental impact. In this elective, students will develop knowledge and understanding of the ecology of marine ecosystems, and the environmental legislation to protect them. They will gather field data from Moreton Bay to investigate human impact on the environment. Students will apply their skills and understanding to the 2032 Olympic and the impact this will have on the coastal ecosystem, in particular the sailing events.

Learning Outcomes

By the completion of this elective, students will:

- understand how environmental value systems impact behaviour
- investigate the human impact on coastal and marine environments
- record and analyse primary and secondary data
- investigate local and global case studies involving the causes and consequences of environmental damage
- evaluate environmental management strategies.

Collaboration

- UQ Faculty of Science; School of Biological Sciences
- Moreton Bay Environmental Education Centre

Medical Biotechnology

Curriculum Focus

Biotechnology harnesses cellular and biomolecular processes to develop technologies and products that help improve our lives and the health of our planet. The term was first used by the agriculturalist Karl Ereky in 1919, when he predicted a time when we could use biology to make useful products from raw materials. In modern biotechnology, researchers modify DNA and proteins to shape the capabilities of living cells, plants, and animals into something useful for humans. Molecular biologists do this by sequencing DNA found in nature, and then manipulating it in a test tube, *in vitro* – or, more recently, inside of living cells, *in vivo*.

The discipline of medical biotechnology uses novel techniques to produce pharmaceutical and diagnostic products that help treat and prevent human diseases. New methodologies have significantly contributed towards improving health science, such as the sequencing of the human genome, uses of stem cells, genetic testing, gene therapy, and the development of antibiotics and vaccines. While there are great advancements and positives to medical biotechnology, the rapid progress of research and techniques also presents a number of new and unique ethical and social challenges within the context of human medical science.

Learning Outcomes

By the completion of this elective, students will:

- develop knowledge and understanding of patterns of inheritance, genes, DNA and the genetic code
- apply and evaluate analytical techniques such as gel electrophoresis
- understand mechanisms for defence against infectious disease and immunity
- explore the impact of vaccinations, antibiotics and the overuse of antibiotics
- evaluate the role, relevance and ethical implications of biomedical science in society.

Collaboration

- UQ Faculty of Science; School of Chemistry and Molecular Biosciences

Future Materials

Curriculum Focus

Materials have been shaping human history since the dawn of civilisation and we continue to develop materials that better conform to our needs by making them stronger, lighter or more durable. Materials research constantly evolves to offer new, superior and smarter materials, and can be based on biomaterials such as spider silk or biopolymers or natural materials such as metals and crystal structures. Advances in technology also allow us to manipulate materials on a nano-scale to produce nanomaterials. The central theory behind materials science involves relating the microstructure of a material to its macromolecular physical and chemical properties. By understanding and then changing the microstructure, material scientists can modify existing materials or create new ones with specific properties for specific uses.

Chemistry is the study of matter, and in this elective, materials will be studied from a unified point of view to understand the relationships between the underlying structure, properties, and utilisation of the material. The elective will explore the chemistry behind materials research, which can be applied in a of contexts such as aerospace travel, sustainable energy production and storage and biomedical applications. Through the study of future materials, students will build a foundational understanding of the essential nature of matter, from metals, alloys, carbon allotropes and polymers to materials that are composites of these for enhanced properties.

Learning Outcomes

By the completion of this elective, students will:

- investigate the chemical and physical properties of matter and materials
- predict and explain the properties of matter and material in relation to their structure.
- represent matter and chemical reactions using chemical formulae and equations
- collect, analyse and evaluate data and solve problems using mathematical methods
- conduct a scientific inquiry concerning an application of materials.

Collaboration

- UQ Faculty of Engineering, Architecture and Information Technology; School of Chemical Engineering

Journey to Earth X

Curriculum Focus

It's 2050 and a team of explorers are leaving Earth to settle exoplanet Proxima b 4.25 light years away. This inaugural interplanetary expedition will have to complete three stages: 1) Leaving Earth, 2) Travelling in interstellar space, 3) Landing on the exoplanet Proxima b

In the first stage, students will learn mechanics and rocketry concepts necessary to successfully launch a self-contained space vehicle. They will explore mathematical, conceptual, graphical and experimental representations of kinematics, forces and energy. During the second stage they will learn astronomy and astrophysics concepts to understand the features and processes of the universe. This will include astronomical measurement, star evolution and cosmology. We will also look at the technology required to sustain interstellar space flight over long distances. Finally, as we prepare to land on Proxima b students will examine fluid friction and momentum change. They will experiment with parachute design and investigate ways to safely control change in speed to facilitate a safe landing on the planet surface.

Learning Outcomes

By the completion of this elective, students will:

- investigate the mechanics of accelerated motion, forces acting on a body and energy transformation
- examine evidence for the Big Bang theory and the possible fates of the Universe
- explore stellar evolution and fusion reactions
- learn about astronomical observational technology and detection of exoplanets
- solve problems using mathematical methods.

Collaboration

- UQ Faculty of Science; School of Mathematics and Physics

Computational Thinking

Curriculum Focus

According to the Jobs of Tomorrow Report from the World Economic Forum (2020), the ability to problem solve 'on the fly' is both a valuable and essential skill for the future. Additionally, with the extraordinary pace of change in digital technologies, many professions of tomorrow will require strong technical expertise with increasing trends for interactive, data-based applications and improved user experience. This elective is designed to engage students in shaping the digital future through computational problem-solving. Computational Thinking lays the foundation for a pathway into the emerging software engineering opportunities that include Cloud Computing, Data Science, Cybersecurity, and Artificial Intelligence.

Computer scientists utilise computational thinking to solve complex problems. Computational thinking builds on the power and limits of computing processes, whether they are executed by a human or by a machine. A part of computational thinking is breaking a problem into simpler components and processes which are capable of collectively solving the problem. Students will explore this process, known as algorithmic thinking, and learn to construct computational solutions to simple and complex problems through a variety of interactive media. As algorithms are intrinsically tied to computer science, a good way to develop problem-solving skills is through learning algorithmic thinking. This elective explores the different specialisations of computer scientists and will culminate with the explicit learning of a programming language to develop students algorithmic thinking and problem-solving skills.

Learning Outcomes

By the completion of this elective, students will:

- explain how problems can be solved through algorithmic thinking
- understand the common building blocks of algorithms, such as iteration and selection
- apply techniques to develop basic and complex algorithms
- synthesize skills and knowledge to design, develop and evaluate solutions.

Collaboration

- UQ Faculty of Engineering, Architecture and Information Technology; School of Information Technology and Electrical Engineering

Peak Performance

Curriculum Focus

Like any human endeavour, sport and exercise evolve over time. Science and technology fuel these changes, providing more advanced equipment made with superior materials, better information about nutrition and training, and improvements in data generation and analysis that help push the limits of athletic capability. Today, sportswear brands are constantly re-inventing clothing and footwear to make it easier for athletes to out-perform themselves, and in the future, everything from shot puts to football turf will be artificially enhanced in order to push the boundaries of human limitations.

The most common method for improving performance in sport and exercise is to improve technique. In this elective, students will study biomechanics as an area of science that encompasses the analysis of the mechanics of human movement. Students will also evaluate training techniques and investigate improvements in equipment and technology that enhance performance in sport and exercise. Sports psychology will also be explored to provide an understanding of the psychological factors associated with peak performance, such as understanding of the different forms of motivation, social learning theory and how to better handle stress. The advantages of improved training techniques, technology, genetics and performance enhancing drugs also raises ethical questions about the future of sport, which will also be investigated.

Learning Outcomes

By the completion of this elective, students will:

- develop knowledge of the fundamentals of biomechanics
- explore ways to measure and optimise physiological performance
- develop and evaluate training programmes
- explore new technologies in sport and exercise
- developing an ability to analyse, evaluate and synthesize scientific information, primary and secondary data.

Collaboration

- Faculty of Health and Behavioural Sciences; School of Human Movement and Nutrition Science

Unpacking the World Around Us

Curriculum Focus

Visual skills are essential for a sophisticated workforce and visual expression is part of everyday communication. Visual acuity, visual literacy and the ability to communicate visually is a staple of 21st century skills. Unpacking the World Around Us will deliver a range of experiences to develop important practical and theoretical skills in visual arts. Students will explore issues of our times, build self-reflective practice, while experiencing great joy and reassurance in their learning journey.

Exploring photography, film, printmaking and mixed media, this elective will build on skills learnt in Foundation Program Visual Arts and extend students to think deeper and learn to use media and materials in new ways.

Learning Outcomes

By the completion of this elective, students will:

- understand how to create and present art
- develop skills in multiple media
- engage in a process of creative exploration and self-discovery
- make purposeful connections between investigation (of materials, media, skills, techniques, artists) and practice
- understand the relationship between art from the past and in the world today
- respond to and reflect on art and art making.

Collaboration

- UQ Art Museum

Intrepid

Curriculum Focus

Music is universal. Intrepid will take students on an adventure in music that crosses borders and unites regions across the globe. Traders and explorers along trade routes throughout the ages returned to their homelands with

more than just spices and textiles, with many bringing back long-lasting impressions of local art including music. Early explorers, travelers, traders, teachers and artists can be all considered living examples of “cultural diplomats” promoting the exchange of ideas, values, traditions and other aspects of culture or identity. Performing artists travel the world for audiences that share common humanity with many utilised by nations to engage in cultural diplomacy. Groups such as the Silk Road Ensemble led by renowned cellist Yo Yo Ma are increasingly popular for bringing together diverse cultures on one stage with an exploration of sound that challenges the norm of what is presented in the concert hall. Cross collaborations are continually on the rise in outdoor or 'pop-up' settings with traditionally conservative music making being presented in a more accessible format to larger and diverse audiences.

Intrepid offers a unique opportunity to explore, engage in and present music from around the world and beyond, including depictions of environment – nature through music. Through external industry experts, students will engage in a journey of imagination and discovery through partnership and collaboration focusing on music that expresses and communicates social and cultural messages, conveys ideas and helps preserve social and cultural traditions. This music elective reflects the substantial global increase in access to digital technologies whilst maintaining a balance of traditional skills. This elective identifies three integrated musical processes — exploring, experimenting and presenting — through which students engage in relevant practical activities.

Learning Outcomes

By the completion of this elective, students will:

- explore culture and identity by drawing on the histories, traditions and conventions of music from other places and times including Australia, Aboriginal and Torres Strait Islander cultures, Asia and other world cultures and environments
- develop critical understanding & perceptual skills in relation to time and place, solo and ensemble performance and composition
- inquire into personal, local and global contexts – engaging with both familiar and unfamiliar music whilst sharing and communicating their music as researchers, creators and performers
- develop a greater appreciation of broader areas such as cultural diplomacy and ethnomusicology with learning and assessment that is encouraging of critical reflection on their own practice, as well as evaluation of their work and the work of others
- consider the interests and concerns of composers, performers and audiences regarding philosophies and ideologies, critical theories, institutions and psychology.

Collaboration

- Faculty of Humanities and Social Sciences; School of Music

International Baccalaureate Diploma Programme

The International Baccalaureate (IB) Diploma Programme (DP) is a rigorous and academically challenging pre-university curriculum for students aged from 16 to 19 years. The programme emphasises the importance of breadth and depth in academic study whilst maintaining a focus on the very way we understand knowledge through the Theory of Knowledge course. Students are encouraged to become active global citizens and understand the importance of care and compassion in an increasingly globalised world. The Diploma encourages students to develop their physical, emotional, intellectual and ethical selves and as such is well regarded and recognised by the world's leading universities.

The IB Diploma Programme curriculum overview

In the DP, students study six subject groups. At QASMT, students may choose to study an additional Sciences or Individuals and Societies subject instead of The Arts.

At the core of the Diploma Programme are the three course requirements that broaden the Diploma program experience and require students to apply their knowledge and understanding. The core includes the *Theory of Knowledge* course, the *Extended Essay* and *Creativity, Activity and Service*.

- **The extended essay** is a requirement for students to engage in independent research through an in-depth study of a question relating to one of the subjects they are studying.
- **Theory of knowledge** is a course designed to encourage each student to reflect on the nature of knowledge by critically examining different ways of knowing (perception, emotion, language and reason) and different kinds of knowledge (scientific, artistic, mathematical and historical).
- **Creativity, activity, service** requires that students actively learn from the experience of doing real tasks beyond the classroom. Students can combine all three components or do activities related to each one of them separately.

Subjects offered in the IB Diploma Programme

The IB curriculum can be best understood through the IB circle, as shown on page 26. Students must study six subjects when undertaking the Diploma Programme, with one subject being chosen from each of Groups 1 to 5. The sixth subject may come from Group 3, 4 or 6. Three subjects must be studied at standard level (equivalent of 150 teaching hours each subject) and three at higher level (equivalent of 240 teaching hours each subject). Subjects are significantly more rigorous at HL level than at SL level. HL courses are designed for students with the high level of skills and understandings needed to succeed with the extra breadth and depth of subject material.

During the two-year program students will also complete an Extended Essay, study a Theory of Knowledge course and participate in the Creativity, Activity & Service course. The International Baccalaureate Organisation (IBO) has comprehensive guidelines that must be adhered to in order for students to receive the IB Diploma qualification.

Subject Overviews

Group 1 – Studies in Language and Literature

English Language and Literature

English Language and Literature provides students with the opportunity to learn about the complex and dynamic nature of language and explore both its practical and aesthetic dimensions. A core element of the course is the examination of the crucial role language plays in communication, reflecting experience and shaping the world. Students will also learn about their own roles as producers of language and develop their productive skills. Language choices, text types, literary forms and contextual elements all effect meaning. Through close analysis of various text types and literary forms, students will consider their own interpretations, as well as critical perspectives of others, to explore how such positions are shaped by cultural belief systems and to negotiate meanings of texts. Students will engage in activities that involve them in the process of production as well as help shape their critical awareness of how texts and their associated visual and audio elements work together to influence the audience/reader's interpretation. With its focus on a wide variety of communicative acts, the course enables students to develop an understanding of the foundational nature, and persuasive influence of language in local, national and global contexts.

The course comprises of three Areas of Exploration: "Readers, Writers and Texts", "Time and Space" and "Intertextuality: Connecting Texts". Students will engage in the inquiry cycle of learning and explore conceptual understandings to underpin their reception and production of texts. Identity, culture, creativity and perspective are a few of the concepts that young learners will explore; in preparation for the Language and Literature Diploma Programme.

Language A Literature (School Supported Self-Taught - SSST)

The IB encourages students to study their Group 1 subject in the Diploma Programme in their mother tongue wherever possible. Non-native English-speaking students at QASMT have the possibility of studying their mother tongue in the Diploma Program as one their six subjects. To accommodate this in the IB Diploma Programme we offer Group 1 in a range of other languages through the School Supported Self-Taught (SSST) program. Students completing their Group 1 subject in a different language to the rest of their course are eligible for a Bilingual Diploma. Language A Literature SSST is available for study in 55 languages. Please note that this is not a language learning course. It is a requirement for all SSST students to study English A as an additional Group 1 subject. Language A Literature SSST is studied instead of a Group 2 subject.

Group 2 – Language Acquisition

Language courses aim to develop a variety of linguistic skills and a basic awareness of the target culture(s) through the study of a core syllabus and language-specific syllabuses.

Language B

Language B is a language acquisition course designed for students with some previous experience of the target language. In the language B course, students further develop their ability to communicate in the target language through the study of language, themes and texts. In doing so, they also develop conceptual understandings of how language works, as appropriate to the level of the course. Students continuing their language acquisition studies from the IB Middle Years Programme, will study the same language in the IB Diploma Programme at Language B.

Ab Initio

This beginner language course is designed for students who have some or no previous experience of learning or speaking the target language. The focus of the courses is on the acquisition of a new language for purposes and situations usual in everyday social interaction. These courses are not available for native speakers or students who have engaged in significant study of the language, including the IB Middle Years Programme. Further details about Ab Initio courses on offer at QASMT will be provided during subject selection for the Diploma Preparation Program.

Group 3 – Individuals and Societies

Business Management

Business Management is a rigorous, challenging and dynamic discipline in the individuals and societies subject group. The role of businesses, as distinct from other organisations and actors in a society, is to produce and sell goods and services that meet human needs and wants by organising resources. Profit-making, risk-taking and operating in a competitive environment characterise most business organisations. The Business Management course is designed to develop students' knowledge and understanding of business management theories, as well as their ability to apply a range of tools and techniques. Students learn to analyse, discuss and evaluate business activities at local, national and international levels. The course covers a range of organisations from all sectors, as well as the socio-cultural and economic contexts in which those organisations operate.

Emphasis is placed on strategic decision-making and the operational business functions of human resource management, finance and accounts, marketing and operations management. Links between the topics are central to the course, as this integration promotes a holistic overview of Business Management. Through the exploration of six concepts underpinning the subject (change, culture, ethics, globalisation, innovation and strategy), the Business Management course allows students to develop their understanding of interdisciplinary concepts from a business management perspective.

Digital Society

The Digital Society course is the study and evaluation of the impacts of information technology (IT) on individuals and society. It explores the advantages and disadvantages of the access and use of digitized information at the local and global level.

Digital Society provides a framework for the student to make informed judgments and decisions about the use of IT within social contexts. Although Digital Society shares methods of critical investigation and analysis with other social sciences, it also considers social and ethical considerations that are common to other subjects in group 3. Students come into contact with IT on a daily basis because it is so pervasive in the world in which we live. This increasingly widespread use of IT inevitably raises important questions with regard to the social and ethical considerations that shape our society today. Digital Society offers an opportunity for a

systematic study of these considerations, whose range is such that they fall outside the scope of any other single discipline.

Economics

Economics, a dynamic social science, is essentially about dealing with scarcity, resource allocation and the methods and processes by which choices are made in the satisfaction of human wants. As a social science, economics uses scientific methodologies that include quantitative and qualitative elements.

The Economics course emphasises the economic theories of microeconomics, which deal with economic variables affecting individuals, firms and markets, and the economic theories of macroeconomics, which deal with economic variables affecting countries, governments and societies. These economic theories are to be applied to real-world issues. Prominent among these issues are fluctuations in economic activity, international trade, economic development and environmental sustainability. The ethical dimensions involved in the application of economic theories and policies permeate throughout the economics course as students are required to consider and reflect on human end-goals and values.

The Economics course encourages students to develop international perspectives, fosters a concern for global issues, and raises students' awareness of their own responsibilities at a local, national and international level. The course also seeks to develop values and attitudes that will enable students to achieve a degree of personal commitment in trying to resolve these issues, appreciating our shared responsibility as citizens of an increasingly interdependent world.

History

History is a dynamic, contested, evidence-based discipline that involves an exciting engagement with the past. It is a rigorous intellectual discipline, focused around key historical concepts such as change, causation and significance. History is an exploratory subject that fosters a sense of inquiry. It is also an interpretive discipline, allowing opportunity for engagement with multiple perspectives and a plurality of opinions. Studying history develops an understanding of the past, which leads to a deeper understanding of the nature of humans and of the world today.

The History course is a world history course based on a comparative and multi-perspective approach to history. It involves the study of a variety of types of history, including political, economic, social and cultural, and provides a balance of structure and flexibility. The course emphasizes the importance of encouraging students to think historically and to develop historical skills as well as gaining factual knowledge. It puts a premium on developing the skills of critical thinking, and on developing an understanding of multiple interpretations of history. In this way, the course involves a challenging and demanding critical exploration of the past.

Psychology

Psychology is the systematic study of behaviour and mental processes. Psychology has its roots in both the natural and social sciences and a variety of research designs are utilised. Overall Psychology provides a unique approach to understanding modern society.

Psychology examines the interaction of biological, cognitive and sociocultural influences on human behaviour, thereby adopting an integrative approach. Understanding how psychological knowledge is generated, developed and applied enables students to achieve a greater understanding of themselves and appreciate the diversity of human behaviour. The ethical concerns raised by the methodology and application of psychological research are key considerations in Psychology.

Psychology takes a holistic approach that fosters intercultural understanding and respect. In the core of the Psychology course, the biological approaches to understanding behaviour demonstrates what all humans share, whereas the cognitive and sociocultural approaches to understanding behaviour reveal the immense diversity of influences that produce human behaviour and mental processes. Cultural diversity is explored and students are encouraged to develop empathy for the feelings, needs and lives of others within and outside their own culture, therefore contributing to an international understanding.

Group 4 – Sciences

Biology

Biology is an experimental science that combines academic study with the acquisition of practical and investigational skills. Biologists attempt to understand the living world at all levels using many different approaches and techniques. At one end of the scale is the cell, its molecular construction and complex metabolic reactions. At the other end of the scale biologists investigate the interactions that make whole ecosystems function. Apart from being a subject worthy of study in its own right, Biology is recommended for students wishing to study medicine, biological science and environmental science in higher education and serves as useful preparation for employment.

Chemistry

Chemistry is an experimental science that combines academic study with the acquisition of practical and investigational skills. It is called the central science as chemical principles underpin both the physical environment in which we live and all biological systems. Apart from being a subject worthy of study in its own right, chemistry is a prerequisite for many other courses in higher education, such as medicine, biological science and environmental science and serves as useful preparation for employment. Chemistry is recommended for students interested in university studies in all science fields, for many universities Chemistry is a pre-requisite study requirement.

Computer Science

Computer science requires an understanding of the fundamental concepts of computational thinking as well as knowledge of how computers and other digital devices operate. The Computer Science course is engaging, accessible, inspiring and rigorous. It has the following characteristics:

- draws on a wide spectrum of knowledge
- enables and empowers innovation, exploration and the acquisition of further knowledge
- interacts with and influences cultures, society and how individuals and societies behave
- raises ethical issues
- is underpinned by computational thinking.

Computer Science students will become aware of how computer scientists work and communicate with each other and with other stakeholders in the successful development and implementation of IT solutions. While the methodology used to solve problems in computer science may take a wide variety of forms, the Computer Science course emphasizes the need for both a theoretical and practical approach.

Environmental Systems and Societies (ESS)

ESS is an interdisciplinary group 3 and 4 course that is offered only at standard level (SL). As an interdisciplinary course, ESS is designed to combine the methodology, techniques and knowledge associated with group 4 (sciences) with those associated with group 3 (individuals and societies). Because it is an interdisciplinary course, students can study ESS and have it count as *either a group 3 or a group 4 course*, or as both. If students choose the latter option, this leaves the opportunity to study an additional subject from any other group, including an additional group 3 or group 4 subject.

ESS is a complex course, requiring a diverse set of skills from its students. It is firmly grounded in both a scientific exploration of environmental systems in their structure and function and in the exploration of cultural, economic, ethical, political, and social interactions of societies with the environment. As a result of studying this course, students will become equipped with the ability to recognize and evaluate the impact of our complex system of societies on the natural world. The interdisciplinary nature of the course requires a broad skill set from students and includes the ability to perform research and investigations and to participate in philosophical discussion. The course requires a systems approach to environmental understanding and problem-solving, and promotes holistic thinking about environmental issues. It is recognized that to understand the environmental issues of the 21st century and suggest suitable management solutions, both the human and environmental aspects must be understood. Students should be encouraged to develop solutions from a personal to a community and to a global scale.

Through the exploration of cause and effect, the course investigates how values interact with choices and actions, resulting in a range of environmental impacts. Students develop an understanding that the connections between environmental systems and societies are diverse, varied and dynamic. The complexity of these interactions challenges those working towards understanding the actions required for effective guardianship of the planet and sustainable and equitable use of shared resources.

Physics

Physics is an experimental science that combines academic study with the acquisition of practical and investigational skills. It is the most fundamental of the experimental sciences as it seeks to explain the universe itself, from the very smallest particles – like quarks and leptons (perhaps 10^{-17} m in size), perhaps truly fundamental – to the size of the universe itself. Students with an aptitude in Mathematics or physical science or simply a desire to work in fields like Astronomy, Nanotechnology, Rocketry, Medicine, Engineering, Dentistry, Architecture or Photonics (to name a few), should consider studying the Physics Programme. A challenging but richly rewarding program of study, with many exciting career options available.

Sport, Exercise and Health Science (SEHS)

SEHS is an experimental science that combines academic study with the acquisition of practical and investigative skills in the context of health and exercise. It is an applied science course, with aspects of biological and physical science being studied within the specific contexts of health and physical activity. Students are introduced to the traditional disciplines of anatomy and physiology, biomechanics, nutrition and training principles. Topics covered in this course include anatomy, function of the musculoskeletal system, physics of motion (forces, Newton's Laws of Motion, projectile motion), nutrition and components of fitness. Students undertake both theory and practical work, and are introduced to the scientific inquiry skills required to successfully undertake a scientific research project. Students apply their learning to practical activities in various indoor and outdoor scenarios, however practical skills are not assessed in this course.

Group 5 – Mathematics

Mathematics has been described as the study of structure, order and relation that has evolved from the practices of counting, measuring and describing objects. Mathematics provides a unique language to describe, explore and communicate the nature of the world we live in as well as being a constantly building body of knowledge and truth in itself that is distinctive in its certainty.

Two courses are available in Mathematics and both subjects are designed to appeal to students with varying levels of ability and motivation in mathematics, but will be developing their mathematics fluency, their ability to think mathematically, to recognise mathematics around them and to be able to use their mathematics in either abstract or contextual settings.

Mathematics Analysis and Approaches

This course is designed for students who enjoy developing their mathematics, to become fluent in the construction of mathematical arguments and develop strong skills in mathematical thinking. They will explore real and abstract applications, sometimes with technology, and will enjoy mathematical problem solving and generalisation. This course caters for students with a good background in mathematics who are competent in a range of analytical and technical skills. The majority of these students will be expecting to include mathematics as a major component of their university studies, either as a subject in its own right or within courses such as physics, engineering and technology. Others may take this subject because they have a strong interest in mathematics and enjoy meeting its challenges and engaging with its problems.

Mathematics Applications and Interpretation

This course is designed for students who are interested in developing their mathematics for describing our world, modelling and solving practical problems using the power of technology. Students who take Mathematics: Applications and Interpretation will be those who enjoy mathematics best when seen in a practical context. This subject is aimed at students who will go on to further education in order to study

subjects such as social sciences, natural sciences, statistics, business, some economics, psychology, and design, for example.

Group 6 – The Arts

Music

Music is an essential part of the human experience and a unique mode of creativity, expression and communication. Music is both functional and meaningful, and its vitality and complexity enriches our lives. Though music is rooted in specific societies and cultures, it also transcends—and often connects—them. Music not only offers a way of understanding the world, but also a means by which we can express and share our understanding of it with others.

Music's many rich histories continue to evolve through individual and collaborative contributions. In the past, as in our contemporary and increasingly digital world, music responds to, and is shaped by, new and emerging technologies and approaches. The study of music encourages inquiry into creative practices and performance processes. Music study develops listening, creative and analytical skills, as well as encouraging cultural understanding and international-mindedness. In this way, music is a catalyst for expanding critical thinking—a crucial life skill. When we understand others and ourselves through music, we are empowered to make positive and effective change in the world.

In this course, students and teachers engage in a journey of imagination and discovery through partnership and collaboration. Students develop and affirm their unique musical identities while expanding and refining their musicianship. Throughout the course, students are encouraged to explore music in varied and sometimes unfamiliar contexts. Additionally, by experimenting with music, students gain hands-on experience while honing musical skills. Through realizing and presenting samples of their musical work with others, students also learn to communicate critical and artistic intentions and purpose.

As students develop as young musicians, the course challenges them to engage practically with music as researchers, performers and creators, and to be driven by their unique passions and interests while also broadening their musical and artistic perspectives.

Visual Art

Visual Art entails the practice and theory of art including understanding of the cultural history and the philosophical framework of art-making. The QASMT art program also includes a focus on design and design thinking, because the edges are blurred between these two creative domains and both art and design offer creative thinking approaches that intersect with ideas in science and technology. The practice of art and design means a focus on the creative studio, where students have the opportunity to explore materials, develop skills in media and apply them to the development of their own creative ideas. A second focus is the investigation of important ideas in art and design history and theory, and assessment is based on both practical and theoretical responses.

The Visual Art program is designed to lay a foundation for creative thinking and creative approaches to working in the studio and with a wide range of materials and media approaches. It will establish key ways of working including documentation of the creative process and a grasp of formative art and design theories and principles.

The Visual Art program is designed for students with a strong interest in art and design who want to develop their creative potential and apply creative thinking in a wide range of other disciplines and career pathways. It is also suitable for students who want to develop more extensive practical folios both to expand their own personal creative potential and in preparation for tertiary programs or future pathways in creative and arts industries.

Queensland Academy of Science, Mathematics & Technology Year 9 Subject Selection – 2023

Subject selections are completed online at OneSchool (oslp.eq.edu.au). Students login using their school username and password, subject selections only become available on the published date in Term 3.

All students study English Language and Literature, Mathematics and their chosen Language Acquisition subject.

Students choose six (6) STEM Futures Electives from the lists below. At least one elective must be chosen from each category. Students must choose a Category A, B and C elective, the remaining three electives can be chosen across any category.

Choose one elective from Category A, B and C (this should be your first preference in each category) and choose five electives from the last section. This is free choice across any category, students must not choose electives they have already chosen in Category A, B or C. Students must select five (5) electives in the additional electives section, as choice four (4) and five (5) will be allocated if their first preferences are not available.

1. **Category A (choose one):**
 - a. Fuelling the Planet
 - b. Biochemical Solutions
 - c. World of Reactions
 - d. Medical Physics
 - e. Sustainable Futures
2. **Category B (choose one):**
 - a. World in Your Pocket
 - b. Forensic Psychology
 - c. Cultural Revolution
 - d. Future Global Cooperation
3. **Category C (choose one):**
 - a. Healthy Future
 - b. Disrupting the Market
 - c. Biomedical Engineering
 - d. Future of Automation
 - e. Artists as Change Makers
 - f. Soundtrack
4. **Additional electives across all categories, do not choose electives you have already selected (choose five in preference order):**
 - a. Fuelling the Planet
 - b. Biochemical Solutions
 - c. World of Reactions
 - d. Medical Physics
 - e. Sustainable Futures
 - f. World in Your Pocket
 - g. Forensic Psychology
 - h. Cultural Revolution
 - i. Future Global Cooperation
 - j. Healthy Future
 - k. Disrupting the Market
 - l. Biomedical Engineering
 - m. Future of Automation
 - n. Artists as Change Makers
 - o. Soundtrack

Please refer any questions about subject selections to the Deputy Principal Performance – Ms Rebecca Skarshewski at rskar2@eq.edu.au or 07 3377 9333.

Please do not return this form, subject selections must be done online through the portal indicated above.

Queensland Academy of Science, Mathematics & Technology Year 10 Subject Selection – 2023

Subject selections are completed online at OneSchool (oslp.eq.edu.au). Students login using their school username and password, subject selections only become available on the published date in Term 3.

All students study English Language and Literature, Mathematics and their chosen Language Acquisition subject.

Students choose three (3) STEM Futures Electives from the lists below. At least one elective must be chosen from each category. Students must choose a Category A, B and C elective.

Choose one elective each from Category A and B (this should be your first preference in each category) and choose three electives from Category C. This is free choice across any category, including The Arts. Students must not choose electives they have already chosen in Category A or B. Students must select three (3) electives in Category C, choice one (1) should be their first preference as choice two (2) and three (3) will be only allocated if their first preference is not available.

1. Category A (choose one):

- a. Show Me the Money
- b. Tragedy of the Commons
- c. Inside Your Head
- d. Global War and Peace
- e. Living in a Digital Society
- f. Blue Planet

2. Category B (choose one):

- a. Medical Biotechnology
- b. Future Materials
- c. Journey to Earth X
- d. Computational Thinking
- e. Peak Performance
- f. Blue Planet

3. Category C (choose three – must be different from choice in Category A & B):

- a. Show Me the Money
- b. Tragedy of the Commons
- c. Inside Your Head
- d. Global War and Peace
- e. Living in a Digital Society
- f. Blue Planet
- g. Medical Biotechnology
- h. Future Materials
- i. Journey to Earth X
- j. Computational Thinking
- k. Peak Performance
- l. Unpacking the World Around Us
- m. Intrepid

Please refer any questions about subject selections to the Deputy Principal Performance – Ms Rebecca Skarshewski at rskar2@eq.edu.au or 07 3377 9333.

Please do not return this form, subject selections must be done online through the portal indicated above.
